Interactive comment on "About the Possibility of Identification of Hydrocarbon Deposits with the Help of NMR" *by* P. Ivashchenko et al.

Anonymous Referee #4

The paper is a very good summary of the discussed technique, with good introduction about the history of the NMR technique. Looks like the authors know very well the issue under discussion. But the real presented work is summarized in the very final part of the draft: less than 50 % of the paper is devoted to the real important results obtained by the authors. Real experimental results obtained on the field by the authors are really poorly presented by figures 11 and 12 and table 1. Figures 11 and 12 impossible to read and to interpret.

All the figures are really simple, some times not so explicative.

Some grammar mistakes and some sentences difficult to understand: e.g. page 5 sentences 10 - 15 not understandable. I recommend to accept the manuscript subject to major technical corrections.
