Received and published: 23 November 2020

The paper deals with an important issue of detecting regional global warming trends in the Nile Basin. The authors use the elaborated statistical technique and data for almost 70 years. The scientific approach sounds. The results are reasonable. The paper is well written and logically organized. However, before publication, I would suggest the authors add non-linear regression results of annual minimum and maximum temperatures. because I think the trend may fit well with non-linear equations
